

UI DESIGN PORTFOLIO — INTERNAL SYSTEM

Dourmouse Design System

Atlas research engine, product lab, agent orchestration UI, and the Tailscale mesh feed — visual language, components, and full screen designs.

Design language

Four decisions shape every screen in this system — now warmer and easier to sit with for a full working session, without losing the clarity a founder needs from live infrastructure data.

01 — FRIENDLY, NOT LOUD

Soft pastel tints replace harsh saturated color. Status is still instantly readable, but nothing on screen feels alarming by default — reserved for when something actually needs attention.

02 — STATUS COLOR STAYS FIXED

Mint green, peach amber, coral red, and lavender purple carry the same fixed meaning as before: pass, waiting, dead, agent identity. Only the saturation changed, not the logic.

03 — ROUNDED, HUMAN TYPE

Quicksand for headlines, Nunito for body text — both warm, rounded sans-serifs. Monospace is kept only for data values and timestamps, where alignment genuinely matters.

04 — SOFT DEPTH, NOT HARD EDGES

Large corner radii and soft colored shadows replace sharp borders — the system now reads as approachable software, not a terminal panel.

Pastel palette

A soft lavender-white base with one periwinkle identity color, and four pastel status colors used identically across every screen.

Background #FBF8FF Base canvas, all screens	Panel #FFFFFF Cards, primary containers	Panel Alt #F3EEFB Rows, nested containers	Border #EAE1F7 Dividers, thin outlines
Periwinkle — Identity #8E9AFF Brand accent, headings	Mint — Pass #59C793 Complete, validated, ready	Peach — Wait #FFB648 Probation, needs approval	Coral — Dead/Fail #FF8FA3 Killed, failed, stop action
Lavender — Agent #B79CF4 Agent-to-agent identity	Text Primary #3D3355 Body text, values	Text Dim #948BB0 Labels, meta, secondary	Mint Tint (badge bg) #DEF7EA Badge / pill backgrounds

Type scale

Quicksand (headlines) + Nunito (body) for a warm, rounded, human feel — JetBrains Mono reserved for data values and timestamps only.

0/28

WHY THIS LAYOUT

Three-stat header answers "how much has actually been tested" in one glance before any detail row.

COLOR USE

Lavender dot = live and running. Mint = confirmed pass. Coral = confirmed dead — never reused for anything else on this screen.

DATA SOURCE

Live-pulled from the Atlas research pipeline; every number traces to a logged test result, never estimated.

Product Lab

D.O.U.R.M.O.U.S.E. // PRODUCT LAB

VALIDATED STRATEGIES — ELIGIBLE FOR PRODUCTIZATION

DUAL MOMENTUM

6 / 6 PASS

holdout t = 4.51

walk-forward p = 0.001

bootstrap $P(\leq 0) = 0.0000$

survives 5x costs

USDJPY NEWS DRIFT

4 / 6 — probation

holdout t = 3.78

vintage audit — clean

real only since 2022

kill gate: 30-60 events

NOT PRODUCTIZABLE — CONFIRMED DEAD

Commodity seasonal calendar trades

VOID

Dollar-basket EUR/USD under-reaction

NO SIGNAL

WHY THIS LAYOUT

Two-column comparison puts a full pass beside a probationary result so the gap in confidence is visually obvious, not just numeric.

STAT BLOCK PATTERN

Every claim is a labeled metric with its actual value — no unsupported "looks promising" language anywhere in this system.

EXPLICIT BOUNDARY

This tab is internal-only by design — nothing here implies a customer-facing product exists yet.

RUNNING

WHY THIS LAYOUT

Model identity is shown as a first-class stat, not buried in settings — it changes constantly during this development phase and needs to stay visible.

CLUSTER HIERARCHY

Nesting reflects real delegation order: admin_ops and atlas report up, jarvis is the newest and most actively iterated agent.

STATUS DISCIPLINE

"Ready" (mint) is idle-and-available; lavender "Running" is the only state actively consuming inference right now.

WHY THIS LAYOUT

Lavender is reserved exclusively for agent identity in this feed — never used elsewhere, so an agent-to-agent message is instantly recognizable.

TRUST SIGNAL

"Encrypted" and node count sit in the header, not buried — this is the one screen where the security model itself needs to be visible.

LATENCY STAT

Included deliberately: mesh handoff speed is a real operational concern given the fanless hardware this all runs on.

END OF PORTFOLIO

Four screens. One friendly system.

Atlas Engine, Product Lab, Dourmouse/Jarvis, and the Tailscale mesh feed all share one pastel palette, one warm typeface pairing, and one status-color language — approachable, without losing the clarity a founder needs from real infrastructure.
